### Re: Levamisole-Adulterated Cocaine: A Case Series

*To the Editor:* Morris et al<sup>1</sup> present several striking cases of likely levamisole-adulterated, cocaine-induced vasculopathy. It is appropriate that they highlight the high index of suspicion needed to diagnose this increasingly common cause of acute, acral predominant retiform purpura and cutaneous necrosis.

As the authors note, detecting levamisole in blood or urine can prove challenging given its short half-life. In addition, only 2% to 5% of the parent drug typically is excreted in the urine, further complicating efforts at detection.<sup>2</sup> A recent report<sup>3</sup> has described the potential utility of testing for levamisole in hair samples from suspected cases using combined ultra-performance liquid chromatography with tandem mass spectrometry, which may further aid in diagnosis of those patients who have delayed seeking medical attention or who last used cocaine more than 48 hours earlier.<sup>4</sup>

Of note, immunologic work-up can be fruitful. In addition to the variable presence of lupus anticoagulant and antinuclear antibodies, the majority of affected patients demonstrate anticytoplasmic neutrophil antibody (ANCA) positivity (perinuclear ANCA greater than cytoplasmic ANCA).<sup>5</sup> Myeloperoxidase antibodies often predominate, although proteinase 3 antibodies can also be observed.<sup>5</sup>

A less recognized but important marker of levamisole-adulterated, cocaine-induced vasculopathy is the detection of human neutrophil elastase antibodies in serum, which may be useful both for confirmation of the diagnosis as well as differentiation from other pauci-immune systemic vasculitides.<sup>5</sup> It is interesting that an antineu-

trophil elastase antibody assay has been developed for use in immunohistochemical staining of human tissues for research purposes, although its application for histopathologic evaluation of skin specimens from patients with this vasculopathy has not yet been reported. Future exploration and validation of this alternative technique may significantly contribute to clinicians' ability to accurately and confidently diagnosis this concerning condition.
