The Centers for Disease Control and Prevention have published national recommendations for improving preconception health and health care in response to unfavorable aspects of the health status of women and children in the United States. The publication explains that the national recommendations are part of a strategic plan for improving preconception health through the provision of clinical care as well as the promotion of changes in individual behaviors, health policy, and public health strategies. The concept of preconception care has been articulated for well over a decade but has not become part of the routine practice of family medicine. Because all women of reproductive age presenting to the primary care setting are candidates for preconception care, the essential and critical role of family physicians in the provision of preconception care is apparent. As a specialty, we are now challenged to devise ways to effectively translate the concept of preconception care into clinical reality. (J Am Board Fam Med 2007;20:81–4.)
Table 1. Summary of 10 Key Recommendations to Improve Preconception Health

1 Individual responsibility across the life span. Encourage each woman and every couple to have a reproductive life plan.
2 Consumer awareness. Increase public awareness of the importance of preconception health behaviors and increase individuals’ use of preconception care services using information and tools appropriate across varying age, literacy, health literacy, and cultural/linguistic contexts.
3 Preventive visits. As a part of primary care visits, provide risk assessment and counseling (education and health promotion) to all women of childbearing age to reduce risks related to the outcomes of pregnancy.
4 Interventions for identified risks. Increase the proportion of women who receive interventions as follow up to preconception risk screening, focusing on high priority interventions (ie, those with high population impact and sufficient evidence of effectiveness).
5 Interconception care. Use the interconception period to provide intensive interventions to women who have had a prior pregnancy ending in adverse outcome (eg, infant death, low birthweight, or preterm birth).
6 Prepregnancy check ups. Offer, as a component of maternity care, one pre-pregnancy visit for couples planning pregnancy.
7 Health coverage for low-income women. Increase Medicaid coverage among low-income women to improve access to preventive women’s health, preconception, and interconception care.
8 Public health programs and strategies. Infuse and integrate components of preconception health into existing local public health and related programs, including emphasis on those with prior adverse outcomes.
9 Research. Augment research knowledge related to preconception health.
10 Monitoring improvements. Maximize public health surveillance and related research mechanisms to monitor preconception health.

Table 2. Preconception Interventions with Evidence for Improving Pregnancy Outcomes

<table>
<thead>
<tr>
<th>Intervention</th>
<th>Proven Health Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folic acid supplementation</td>
<td>Reduces occurrence of neural tube defects by two thirds.</td>
</tr>
<tr>
<td>Rubella vaccination</td>
<td>Provides protection against congenital rubella syndrome.</td>
</tr>
<tr>
<td>Diabetes management</td>
<td>Substantially reduces the 3-fold increase in birth defects among infants of diabetic women.</td>
</tr>
<tr>
<td>Hypothyroidism management</td>
<td>Adjusting levothyroxine dosage early in pregnancy protects proper neurologic development.</td>
</tr>
<tr>
<td>Hepatitis B vaccination for at risk women</td>
<td>Prevents transmission of infection to the infant and eliminates the risk to the woman of hepatic failure, liver carcinoma, cirrhosis, and death due to HBV infection.</td>
</tr>
<tr>
<td>HIV/AIDS screening and treatment</td>
<td>Allows for timely treatment and provides women (or couples) with additional information that can influence the timing of pregnancy and treatment.</td>
</tr>
<tr>
<td>STD screening and treatment</td>
<td>Reduces the risk of ectopic pregnancy, infertility, and chronic pelvic pain associated with Chlamydia trachomatis and Neisseria gonorrhoea and reduces the possible risk to the fetus of fetal death and physical and developmental disabilities, including mental retardation and blindness.</td>
</tr>
<tr>
<td>Maternal PKU management</td>
<td>Prevents babies from being born with PKU-related mental retardation.</td>
</tr>
<tr>
<td>Oral anticoagulant use management</td>
<td>Switching women off teratogenic anticoagulants (ie, warfarin) before pregnancy avoids harmful exposure.</td>
</tr>
<tr>
<td>Antiepileptic drug use management</td>
<td>Changing to a less teratogenic treatment regimen reduced harmful exposure.</td>
</tr>
<tr>
<td>Accutane use management</td>
<td>Preventing pregnancy for women who use isotretinoin (Accutane) or ceasing isotretinoin use before conception, eliminates harmful exposure.</td>
</tr>
<tr>
<td>Smoking cessation counseling</td>
<td>Completing smoking cessation before pregnancy care can prevent smoking-associated preterm birth, low birth weight, or other adverse perinatal outcomes.</td>
</tr>
<tr>
<td>Eliminating alcohol use</td>
<td>Controlling alcohol binge drinking and/or frequent drinking before pregnancy prevents fetal alcohol syndrome and other alcohol-related birth defects.</td>
</tr>
<tr>
<td>Obesity control</td>
<td>Reaching a healthy weight before pregnancy reduces the risks of neural tube defects, preterm delivery, diabetes, cesarean section, and hypertensive and thromboembolic disease that are associated with obesity.</td>
</tr>

PKU, phenylketonuria.
parent. Family physicians provide much of the health maintenance, family planning, and chronic disease care for women, and strive to maintain continuity of care (often before, after, and between pregnancies) and close relationships with their patients. A recent survey documents that women prefer to receive preconception health information from their primary care physicians. As a specialty, we are now challenged to effectively translate the concept of preconception care into clinical reality. This is a clinical and public health domain where Family Medicine must assume a leadership role or be usurped by other disciplines with far less impact than could otherwise be realized.

In the short term, family physicians could do 2 things to promote preconception health and health care. First, ask every woman of reproductive age whether she intends to become pregnant in the next year. Asking every woman about her reproductive intentions promotes the idea that pregnancies should be intended and planned by providing contraception to the woman who does not intend to conceive and promotes the initiation of preconception care strategies for women if and when they do desire to become pregnant. Second, inform women that health conditions and medications can affect pregnancy outcomes and that pregnancy can affect a woman’s health.

In the longer term, aspects of the national recommendations could be incorporated into the Future of Family Medicine Project’s “New Model” of family medicine, which promotes the provision of team-based, patient-centered care and a commitment to providing an essential “basket of services.” We advocate that the intentional provision of preconception care be included in family medicine’s essential “basket of services.”

All women of reproductive age and potential presenting to the primary care setting are considered candidates for preconception care. Some have expressed concern that the national recommendations excessively focus the health care encounter on a woman’s reproductive potential. However, the intent of the national recommendations is to empower women by promoting reproductive planning linked with the provision of contraception to prevent unintended pregnancies and by providing them with relevant information to make their own informed decisions.
