

POLICY BRIEF

Care Coordination and Population Management Services Are More Prevalent in Large Practices and Patient-centered Medical Homes

Miranda Moore, PhD, Lars Peterson, MD, PhD, Megan Coffman, MA, and Yalda Jabbarpour, MD

Despite efforts to better coordinate health care and improve population health, primary care practices may face difficulty dedicating an individual to provide these services. Using data from the American Board of Family Medicine, we found that the presence of care coordinators or population health managers was higher in larger practices and those with patient-centered medical home certification. (J Am Board Fam Med 2016;29:652–653.)

Keywords: Certification, Delivery of Health Care, Family Practice, Health Services, Patient-centered Care

With the passage of the Medicare Access and CHIP Reauthorization Act in 2015, Congress intends to improve the quality of care through value-based purchasing under the Merit-based Incentive Payment System program. Comprehensive Primary Care Plus is a Medicare-funded effort to radically expand practice transformation. For both of these efforts to succeed, primary care practices will need to coordinate care for their patients and provide population health management services. Having a staff member function as a care coordinator has been associated with improved quality through increased medication adherence and enhanced chronic disease care and preventive care.¹ Similarly, many care coordinators provide popula-

tion health management services, which have been associated with reduced utilization and costs.^{2,3} Some primary care practices may face challenges in providing personnel dedicated to coordinating care for their patients, particularly small practices and those that have not undergone patient-centered medical home (PCMH) transformation.

We used data from family physicians recertifying with the American Board of Family Medicine in 2014 and 2015. A practice demographic questionnaire is a mandatory part of the application. In these years, one fourth of applicants were asked, using a round-robin method, whether their practice had access to someone who functions as a care coordinator or provides patient population management services. Respondents were also asked whether their practice was a PCMH and the number of providers in their practice. We compared the percentage of respondents reporting the presence of a care coordinator or population health manager by PCMH status and practice size.

Just over half (53.1%) of the 4649 respondents reported having a care coordinator or population health manager. Respondents in solo and non-PCMH practices reported the lowest presence of care coordinators, at 27.0% (158 of 586), whereas nearly 90% (354 of 395) of those in large PCMH practices (≥ 20 providers) reported having a care coordinator (Figure 1).

If effectively designed and implemented, care coordination and population health management each

Figure 1. Percentage of family physicians reporting having a care coordinator or population health manager at their primary practice, by practice size and patient-centered medical home (PCMH) status. Nearly one-third (31.2%) reported working in a PCMH; 14.2% were in a solo practice, 35.8% in small practices, 31.4% in medium-sized practices, and 18.6% in large practices. have the potential to improve patients' well-being and together are 1 of the 10 building blocks of high-performing primary care.³⁻⁵ Having a dedicated staff member provide such services may be ideal to ensure these functions are conducted, but such personnel seem to be disproportionately prevalent in large practices and PCMHs. Stakeholders should consider ways new programs such as the Merit-based Incentive Payment System and the Comprehensive Primary Care Initiative can be tailored to better meet the needs of small practices and those that have yet to transform to a PCMH to ensure they meet their intended goals of improving quality.
