

BRIEF REPORT

Provision of Early Pregnancy Loss Care in New York Federally Qualified Health Centers

Amanda Nagle, BS, Silpa Srinivasulu, MPH, Lisa Maldonado, MA, MPH, and Gabrielle deFiebre, MPH

Background: Office-based early pregnancy loss (EPL) care is safe and suitable to Federally Qualified Health Centers (FQHCs); prevalence of provision in FQHCs is unknown.

Methods: We conducted a mailed site-level survey of FQHCs in New York State (n = 405). Sites that offered prenatal care were eligible for analysis. Questions included provision of and barriers to providing EPL care options. Content analysis was used for write-in responses to barriers. We conducted bivariate analyses using Fisher's Exact tests and risk ratios to investigate associations between EPL care provision and the independent variables site urbanicity, prenatal clinician type, and ultrasound access.

Results: Of 181 mailings returned, 63 sites were eligible (response rate 44.7%); 88.9% provided expectant management, 53.9% medication management, and 23.8% uterine aspiration. Common barriers included lack of clinical infrastructure, poor ultrasound access, and insufficient training. Some held perceived barriers regarding uterine aspiration. Sites with regular ultrasound access were 1.85 times as likely to provide uterine aspiration as sites without regular ultrasound access (95% CI, 1.16–2.95).

Conclusions: Few New York FQHCs provided comprehensive EPL care. Supporting FQHCs to overcome barriers may expand access to EPL treatment in primary care and increase continuity and patient centeredness. (J Am Board Fam Med 2021;34:238–242.)

Introduction

Nearly 1 in 5 pregnancies end in early pregnancy loss (EPL), also called miscarriage.¹ Historically, EPL was managed with operating room surgery under sedation, which is mostly no longer necessary.² First-trimester EPL management in office-based settings is safe, effective, and acceptable.³ Care includes “watch and wait” (expectant management), medication management, and uterine aspiration with local

anesthesia. Expectant management is highly effective for treating incomplete miscarriage; medication and uterine aspiration are more effective for anembryonic gestation and embryonic demise.^{4–6} All options are safe and effective; therefore, professional medical organizations recommend that patient preference should guide treatment choice.^{3,7} Compared with operating room surgery, many patients prefer uterine aspiration in primary care as it is equally safe, more affordable, and feasible.^{8,9} Comprehensive EPL care in primary care can help maintain continuity of care, as patients who go to emergency rooms may feel unsupported and lack follow-up plans.¹⁰

Federally Qualified Health Centers (FQHCs) provide affordable health care to 29 million people nationally, and to over 2.2 million people in New York State. They care for underserved populations and reduce barriers, like cost and distance, to services. They are important sources of prenatal care and contribute to reducing prenatal care disparities; FQHC patients nationally have lower rates of low birth

weight compared with US patients overall.¹¹ Most FQHC clinicians are family physicians and advanced-practice clinicians (APCs), like nurse practitioners, physician assistants, and midwives.⁵ Family physicians and APCs in FQHCs are well positioned to increase access to EPL care, as part of comprehensive prenatal care. Their scope of practice includes outpatient procedures and maternal and reproductive health care, including uterine aspiration.^{12,13} However, the proportion of FQHCs providing these services is unknown. This study assesses the provision of EPL management in New York State FQHCs and barriers to providing this care.

Methods

In 2015, we conducted a cross-sectional study of FQHCs in New York State, using the Health Resources and Services Administration's Uniform Data System to identify sites. We defined clinic sites as the unit of measurement, as health care organizations may manage multiple sites and offer different services at each. This produced a list of 651 FQHC sites.

Only those that provided prenatal care were eligible to complete the core survey. We used information from the Uniform Data System list, that is, name and type of care provided, and online investigating to remove 246 sites that were duplicates, permanently closed, or clearly did not provide prenatal care, such as administrative offices, dental-only sites, and school-based health centers. We mailed the remaining 405 potentially eligible sites a prenotice letter then the paper-based survey, addressed to the medical director. To engage nonresponders, we employed the Dillman mailed survey methodology and contacted nonresponding sites up to 3 more times.¹⁴

The mailing included a screener on providing prenatal care to determine eligibility. Sites that provided prenatal care were invited to continue the survey. Nonprenatal care sites returned the survey with only the first few screening questions completed. The survey contained questions on sites' practice characteristics and provision of each EPL treatment option. We asked sites that did not provide a particular option to select from a list and/or write-in barriers to offering that care.

Characteristics, EPL provision, and barriers were analyzed using descriptive statistics. We grouped write-in responses for site type into new categories. To assess nonresponse bias, we estimated site

counties using address information from the Uniform Data System and conducted chi-square analysis on respondent and nonrespondent site urbanicity. We conducted bivariate analyses using Fisher's Exact tests and risk ratios to investigate associations between the outcomes 1) providing 2 or more EPL management types, and 2) providing uterine aspiration; and the independent variables 1) site urbanicity, 2) OB/GYN as prenatal care clinician, and 3) regular ultrasound access. We used SAS University Edition (SAS Institute, Cary, NC) for quantitative analysis; significance set at $P = .05$.

Content analysis was used to analyze write-in barriers.¹⁵ Through analysis, we found potential misconceptions and categorized them as "perceived barriers." In this process, we did not intend to evaluate respondents' knowledge of EPL care provision, but to understand how potential misunderstandings may occur. The Institutional Review Board of the Institute for Family Health approved this study.

Results

Of sites we attempted to contact ($n = 405$), 181 mailings were returned with 63 eligible sites completing the screener and main survey and 118 ineligible sites completing only the screener. The survey had a 44.7% response rate, according to American Association for Public Opinion Research Response Rate,³ where the eligibility rate among nonrespondents was assumed to be equal to the eligibility rate among those completing the screener.¹⁶ Responding sites ($n = 118$) did not differ significantly on urbanicity from those that did not respond ($P = .25$).

Most respondent sites were urban and had family physicians and/or APCs providing prenatal care (Table 1). Figure 1 illustrates combinations of EPL care options offered at responding sites. Only 22.2% provided all 3 office-based treatments; uterine aspiration was the least available option. Across EPL management types, respondents frequently mentioned that lack of clinical infrastructure and poor access to ultrasound were major barriers to providing care (Table 2). Sites with regular ultrasound access were 7.2 times as likely to provide 2 or more EPL management options (95% CI, 2.43–21.29) and 1.85 times as likely to provide uterine aspiration (95% CI, 1.16–2.95) as sites without regular ultrasound access (Table 3).

Perceived barriers were identified only within write-in responses to challenges to providing

Table 1. Attributes of FQHCs in New York State that Provide Prenatal Care (n = 63)

Characteristic	N (%)
Site type	
Primary care	58 (92.1)
Reproductive health or OB/GYN*	4 (6.3)
Multi-specialty health center*	1 (1.6)
Urbanicity (n = 61)	
Urban	47 (77.0)
Suburban	6 (9.8)
Rural	8 (13.1)
Types of clinicians that provide prenatal care at each site (n = 62) [†]	
Advanced-practice clinician (nurse practitioner, physician assistant, midwife)	49 (79.0)
Family physicians	44 (71.0)
OB/GYN	36 (58.1)
EPL care provision	
Expectant management	56 (88.9)
Medication management	34 (53.9)
Uterine aspiration	15 (23.8)
None	7 (11.1)
Site sees patients who present with suspected EPL	55 (87.3)
Site has regular access to ultrasound	30 (47.6)

EPL, early pregnancy loss; FQHC, Federally-Qualified Health Center; OB/Gyn, Obstetrics and Gynecology.

*These sites selected “other site type, please specify” on the survey and self-identified. The research team categorized responses accordingly.

[†]These categories are not mutually exclusive. Respondents may have selected multiple options.

uterine aspiration. Among sites that did not provide uterine aspiration (n = 48), 14.6% mentioned a perceived barrier. We found 2 themes: clinicians’ scope of practice (n = 3) and physical space required (n = 4). One respondent shared, “[we have] no provider able to do [uterine aspiration]. OB/GYN care [is] handled only by midwives—not in scope of practice.” While some sites may not have sufficiently trained APCs, this quote suggests that APCs cannot provide uterine aspiration. Some respondents may be unaware that APCs’ scope of practice includes uterine aspiration. In addition, some believed they required an operating room to provide uterine aspiration, as one respondent stated: “no operating room on site.”

Discussion

This study demonstrates that few FQHCs in New York, a state with progressive health care access

policies, offer comprehensive EPL management. Many experienced systems and training challenges to provide care. These barriers are not unique to New York FQHCs; previous studies identified similar primary care challenges like clinical training, staff resistance, and ultrasound access.^{17,18} Expanding local training opportunities at sites with higher EPL volume may strengthen clinicians’ skills to provide full-scope EPL care in FQHCs.^{12,19,20} One promising model, the Hands-on Reproductive Health Training Center, predominantly trains APCs from New York City FQHCs in long-acting reversible contraception counseling, insertion, and removal, and has shown to strengthen APCs’ procedural skills.²¹ In addition, as point-of-care ultrasound in family medicine residencies in FQHCs grows, some clinicians will have more opportunities to develop ultrasonography skills needed for EPL management.²²

In our study, some sites perceived barriers to comprehensive EPL provision regarding types of clinicians allowed to provide uterine aspiration and infrastructure needs. These challenges are opportunities to educate FQHC staff and build shared values around the importance and feasibility of providing EPL care. For example, Washington State’s Residency Training Initiative in Miscarriage Management provides family medicine sites intensive assistance to integrate uterine aspiration for EPL.¹⁷ Similarly, the Miscarriage Care Initiative supports family physicians to work with all health center staff to resolve misunderstandings, articulate values, and work through steps to implement EPL care.^{17,23} FQHCs may benefit from such programs as they often have limited resources and time to solve these challenges on their own.²⁴

Figure 1. Early pregnancy loss (EPL) care in New York federally-qualified health centers (FQHCs).

Table 2. Barriers to Providing Comprehensive EPL Care Among New York FQHCs

Reasons Why Care Was Not Provided*	Expectant Management (n = 7)	Medication Management (n = 29)	Uterine Aspiration (n = 48)
Lack of clinical infrastructure to support care	71.4%	62.1%	66.7%
Medication not stocked/no supplies	N/A	65.5%	60.4%
No ultrasound access	71.4%	62.1%	45.8%
Automatically refer out for this care	62.1%	48.3%	58.3%
No clinician trained in EPL care option	28.6%	55.2%	47.9%
No trained ultrasound clinician	28.6%	44.8%	37.5%
Malpractice insurance does not cover	28.6%	3.4%	8.3%
Too similar to abortion care	N/A	3.4%	6.3%
Patient population does not present with EPL needs	28.6%	0%	0%

EPL, early pregnancy loss; FQHC, Federally-Qualified Health Center.

*All barriers shown include prespecified options respondents could select from a list.

This study has limitations. Analysis of nonresponse bias was limited by a lack of information about sites that did not return the mailing. We had a moderate response rate and strict eligibility criteria leading to a small sample for analysis. As such, some FQHCs that did not provide prenatal care could have offered EPL management or faced barriers similar to or different from prenatal care sites. The interpretation of perceived barriers is inherently subjective and limited by respondents' details. Findings may not be generalized outside of New York.

Despite limitations, this study estimates the prevalence of EPL care in New York State FQHCs. Though few provided all options, doing so is safe, effective, acceptable, and within the FQHC scope of care.³ Offering comprehensive EPL management in FQHCs is an important component of patient-centered care, as it enhances continuity, reduces burdens to find care elsewhere, and allows patients to actively decide how to manage their EPL, improving health outcomes.²⁵ Expanding clinical training opportunities and working with FQHC staff to address systems

Table 3. Bivariate Analysis of New York State FQHC Characteristics and EPL Management Provision

Characteristic	Effect Size (n, % or Risk Ratio)		P or 95% CI
	2+ EPL Management Options Provided (n = 35)	0 to 1 EPL Management Options Provided (n = 28)	
Urbanicity*			
Urban	25 (75.8%)	22 (78.6%)	0.82
Suburban	4 (12.1%)	2 (7.1%)	—
Rural	4 (12.1%)	4 (14.3%)	—
OB/GYN providing prenatal care	RR = 1.26	—	0.80-1.97
Regular access to ultrasound	RR = 7.20	—	2.43-21.29
	Uterine Aspiration (n = 15)	No Uterine Aspiration Provided (n = 48)	
Urbanicity*			
Urban	9 (69.2%)	38 (79.2%)	0.48
Suburban	1 (7.7%)	5 (10.4%)	—
Rural	3 (23.1%)	5 (10.4%)	—
OB/GYN providing prenatal care	RR = 0.77	—	0.43-1.39
Regular access to ultrasound	RR = 1.85	—	1.16-2.95

barriers may increase availability of comprehensive EPL care.^{12,19} Future research should explore the extent to which FQHCs nationally provide EPL management and strategies to support them integrate this care into practice.
