ABFM Journal Club's Focus on Critical Appraisal of Full Research Articles Is Misplaced

To the Editor: We read with interest the commentary by Drs. Quan and Newton describing the plan of the American Board of Family Medicine (ABFM) to develop a Journal Club as an optional continuing certification activity.¹ They propose to have a national committee select 100 high-quality, potentially practice-changing research articles relevant to family medicine each year and to require Journal Club participants to read the full text of an article and correctly answer 4 multiple-choice questions to earn credit.

Having collectively taught thousands of medical and graduate students how to critically appraise the medical literature, we nonetheless think that it is unrealistic to expect most busy clinicians to learn or even want to learn how to critically appraise full research articles to inform their clinical practices. Rather than trying to stay current by evaluating individual studies, family physicians should pursue Information Mastery,^{2,3} which emphasizes selecting good sources of preappraised patient-oriented evidence that matters (POEMs) for foraging (keeping up with new information) and hunting (quickly accessing information at the point of care) purposes.⁴

Although the authors suggest that having Journal Club participants read full research articles will improve shared decision making and personalized care, we are not aware of any empiric evidence or data from the other Boards to support this assumption.⁵ In fact, this approach could create inappropriate expectations and become counterproductive. We and others have found that attempting to teach critical appraisal skills to clinicians results in them concluding (correctly) that it is too time-consuming and difficult to do in the rush of everyday life; instead, they often revert back to relying on questionable information from easily accessible sources (eg, pharmaceutical companies) and “key opinion leaders” with financial conflicts of interest.⁶

As proposed, the ABFM Journal Club will likely self-select a small group of family physicians who are interested and/or have extra time for this intensive activity but will have a minimal impact on the critical thinking and information management skills of the specialty as a whole.

Why can't there be 2 options? There could be a “deep dive” option for those who want to learn to critically evaluate articles as well as a more inclusive option for those who prefer summaries of preappraised POEMs with key take-home points. Several of us have been writing approximately 250 POEMs per year and publishing many of them in family medicine journals for the past 20 years.⁷ In a research study, Canadian family physicians who were

given access to an electronic knowledge resource including POEMs reported that their searches resulted in health benefits for their patients.⁸ So, if the Board's goal is to enhance skills that actually improve practice outcomes, they could adopt a similar approach of providing physicians ongoing access to preappraised evidence and teaching information mastery. This proven model is more user friendly than one that tries to teach critical appraisal of individual studies, an approach that we think falls short in terms of relevance and the work involved.²

We agree with Drs. Quan and Newton that family medicine can and should lead the way to better patient care with better information. We disagree, however, that focusing on the appraisal of original research is the best or singular path to realize that goal.

Re: ABFM Journal Club's Focus on Critical Appraisal of Full Research Articles is Misplaced

Dear Drs. Lin, Barry, Ebell, Grad, Shaughnessy, Siwek, and Slawson:

Thank you for your letter, and thank you for raising what is a critical issue for the future of our specialty!

Over the past 30 years, the critical appraisal/evidence-based medicine (EBM) movement has made great strides, with your work playing a crucial role. Patient-oriented evidence that matters (POEMs), a term coined by some of you, is foundational for family physicians' practice of EBM. We appreciate very much your major contributions—providing evidence at the point of care, to journals, to Canadian physicians widely, and increasingly into continuing medical education. As colleagues who were there with you at the beginning, we also celebrate your development of a business model for facilitating the practice of EBM in InfoPOEMs and Essential Evidence Plus.

Our task is different from yours. The actual design of the proposed ABFM National Journal Club¹ is important to keep in mind. The Journal Club is designed as an optional, not required, continuing certification activity; in addition, Diplomates will be able to choose only those articles they want to study in greater depth. Members of the National Journal Club Committee, who will select the journal club articles and write the accompanying critiques and commentaries, were selected from nominations from all of the specialty organizations and chosen for their clinical experiences, expertise in EBM, and diversity along a number of dimensions. Our literature search process will be explicit and “2 tiered”—building on the foundation you and others have built. In keeping with changes in board certification² and in developing educational theory, our process will include independent assessment and learner engagement and embraces a

mastery³ approach. All of these features are critical for knowledge retention and application. How many of us have looked up the same information more than once? Like InfoPOEMs, PURLS (Priority Updates from the Research Literature), and similar EBM services, we will endeavor to discuss the findings of individual articles within the context of other important literature and provide clinical direction, modulated by the collective opinion of a geographically diverse committee. Finally, the ABFM National Journal Club, which will identify the top 100 articles for family physicians each year, will be more selective than InfoPOEMs (approximately 250 articles/year) or NEJM Journal Watch (approximately 400 articles/year). We hope that our curation of the most important literature available will be valuable for Diplomates.

You question the value of reading full text articles. Do we really believe that family physicians should not read full text articles after completing residency? Will medical students choose to go into a field in which that is an expectation? Despite widespread information overload, no other specialty has taken that stance, and physicians report that peer-reviewed articles are viewed as the most useful and influential medical information source.⁴ We believe that we can help make this process more efficient and manageable. More broadly, we believe that knowing the primary literature—the details and limitations, along with the context of other literature—can help customize patient counseling and informed decision-making. Practicing family medicine is more than knowing disease management pathways and care algorithms.

Good-quality information can also empower family physicians as they advocate for their patients with subspecialists, payers, and hospital systems across the continuum of care. We believe that this often requires a greater depth of knowledge than summaries can provide. We agree with you that keeping up with methodology seems challenging to many, which is why we will include questions on methodology in our assessments. We do not agree, however, that family physicians should rely on outside experts, however well intentioned and sophisticated, to pronounce *ex cathedra* on what family physicians need to know and to do.

The ABFM Journal Club is still in the developmental phase. Our pilot this summer will test both feasibility—can we combine the many components of this project, from article selection to item writing to access to full articles to the information technology backbone?—and also its value to practicing family physicians. We also hope to collaborate with AFMRD and others to promote innovation in teaching and learning using this service. As always, ABFM is committed to continuous quality improvement. We do rigorous evaluation—and act on it.

Thank you once again for your many contributions to this important area. We look forward to the possibility of collaborating with you in the future.
