

party for those long-term residents in the facility. While observing the residents' involvement in the celebration activities, the social workers, nursing staff, and attending physician can use such an occasion to consider what, if any, screening activities would be appropriate before the next birthday party. With woefully inadequate financial reimbursement and limited professional satisfaction (at least in the traditional sense) offered to nursing home providers, such systems of reminders can be useful for nursing home physicians to incorporate into their practice styles.

Finally, I would stress the critical role that advance directives can play within the whole area of health promotion for long-term care residents. For residents who are cognitively intact and who retain the capacity to express their desires through health care proxy statements, living wills, or whatever legally acceptable instruments exist in the state, the incorporation of such statements for preterminal care, transfer out of the facility for testing, and provision of artificial hydration and nutrition not only is appropriate within the context of health promotion but also addresses the general idea of death as a natural part of life. Even for those residents who lack the capacity to use such advance directives, encouraging families to discuss and perhaps provide written statements interpreting their relative's earlier wishes and directives can be useful to guide medical decision making (if not effective in legal proceedings) and can help direct health promotion decisions that work to minimize morbidity without denying the ultimate mortality of the long-term care resident.

John M. Heath, M.D.

1. Richardson JP. Health promotion for the nursing home patient. *J Am Board Fam Pract* 1992; 5:127-36.

The above letter was referred to the author of the article in question, who offers the following reply.

To the Editor: I thank Dr. Heath for his comments. I am glad that he shares my interest in health promotion for residents of nursing homes, and I agree that nurses and health assistants can provide valuable information regarding patients' and families' values, if only we physicians would consult them.

I also like Dr. Heath's idea of using birthday celebrations as a way to consult with other members of the team in the nursing home. I wonder, however, how often physicians with busy office practices would be able to attend celebrations such as these, which are typically held during the workday.

Dr. Heath and I both agree that advance directives are even more important for nursing home residents than they are for other elderly persons. As I mention in my article, I concur with him that ad-

vance directives are a part of health promotion for this patient population. Unfortunately, educating patients about advance directives can be a very difficult and time-consuming task. Nevertheless, it is an important part of health promotion and can greatly affect the quality of life of a nursing home resident.
