Headache after Lumbar Puncture

To the Editor: I read the recent article "Chronic Headaches in Family Practice" by Robert Smith.¹ I have had 5 years experience in family practice before beginning my anesthesia training, which gives me a somewhat unique point of view. While the article was very informative, I would like to point out some incorrect information that appeared on p. 594 concerning postlumbar puncture headache.

While it is correct that lower cerebral spinal fluid (CSF) pressure is believed to be the cause of the headache and that the hallmark of a postdural puncture headache is relief when the patient lies flat, the information about a blood patch is incorrect.

If a postdural puncture headache lasts 24 to 48 hours and fails to respond to intravenous hydration and caffeine, then the treatment of choice is an epidural blood patch. Ten to 20 mL of the patient's whole blood is aseptically injected into the *epidural* space at a vertebral interspace as close as possible to the previous dural puncture. The blood is injected slowly with the end point of headache relief or 20 mL. This is effective 90 percent of the time.²

The blood patch works by forming a clot on the *outer* surface of the dura and blocking the leak of CSF. This action prevents the lowered CSF pressure and hence the headache resolves. No further subarachnoid injections are needed, as was stated in the article.

Rodger Orman, MD

The preceding letter was referred to the author of the article in question, who responds as follows:

To the Editor: Thanks to Dr. Orman for his informative letter. His expanded description of the postlumbar headache treatment method makes a useful addition to my recent article. He rightly corrects my account of the mechanism of the blood patch by pointing out that the injection is made into the epidural, not into the subarachnoid space. It is good to be corrected on a matter such as this by a family physician.

Single-Payer System

To the Editor: Dr. Howard Brody's editorial on the American Academy of Family Physicians' plan for addressing current problems with health care in the United States¹ is on the mark in most respects, but the author's assessment of the benefits to be derived from switching to a single-payer system appear unduly optimistic.

As the editorial states, the much-touted figure of \$50 billion in annual savings would require not only the adoption of a single-payer system but also a program of global budgets for health care institutions. In effect, the government would negotiate (while holding the purse strings) how much it would pay each hospital or other health care facility for a year's services. Each institution would be forced to survive, if possible, on its allotment. This outcome is not inevitably bad and it might be unavoidable,² but it would be stressful for administrators, professionals, staffs, and probably also for patients, and it could have a considerable adverse impact on quality of care.

The much-quoted Woolhandler and Himmelstein article³ has been largely discredited by subsequent analysis in the same journal's "Letters"⁴ and elsewhere.⁵ The article reflected a diligent effort to compare costs under the present US and Canadian systems but foundered on discrepancies in what was measured and on multiple, sometimes unquantifiable differences in the two nations' health delivery systems. The latter include the level of entrepreneurial activity by physicians, the impact of a "medical-industrial complex" on decision making, the expectations of patients, and the proportion of physicians doing primary care.

As noted by Ginzberg² and others, recent and projected increases in medical spending in the United States are of such magnitude that no viable scheme in our present political climate is likely to bring about the required cost savings. Wennberg⁶ asserts that the necessary economies could be derived from making our system more rational (in his context, by persuading Boston physicians to practice as economically as those in New Haven), but changes in medical practices and standards of this magnitude could require decades, even with strong persuasion from third-party payers.

To underscore the enormity of the crisis, consider that an annual saving of \$50 billion, even if it could be achieved, would be swallowed up within a year by the relentless increase in health care costs, which have continued to expand at two to three times the inflation rate despite diverse and increasingly powerful attempts to contain them. Dr. Brody is correct in asserting that the AAFP proposal falls short of what is needed, but any plan Draconian enough to address the problem adequately would, in the present climate of US public and professional opinion, be politically nonviable.

To the Editor: I would like to comment in reference to the editorial in the November–December 1992 issue entitled “The AAFP Access Plan: Getting It Almost Right” by Howard Brody. Dr. Brody contends that health care in the United States is a “nonsystem.” He relates that it is administratively inefficient and drives up costs two ways: “First, more employees are needed to process all the different payers. Second, more employees are needed to track each item of care and supplies dispensed”

Certainly, few physicians in private practice would argue that a more simplified system is needed. However, Dr. Brody’s solution to this administrative waste is a single-payer system. A single-payer system, I assume, would be the government, or more specifically the federal government. He further contends that the only reason not to take that last step (of creating a single-payer system) is to maintain “the ideological veneer of private enterprise.”

I am left to conclude, therefore, that Dr. Brody’s answer to reducing administrative waste and a burgeoning bureaucracy in our current health care system is to turn the whole thing over to the federal government, the same government that has created a \$4 trillion deficit and increases it daily by \$1 billion. If this is Dr. Brody’s contention, then I will take “the ideological veneer of free enterprise” over federal peckerwood any day.

Neal D. Jacobson, DO
Baker City, OR

The preceding letters were referred to the author of the article in question, who offers the following reply:

To the Editor: Dr. Gillette notes a number of obstacles to the implementation of substantial health care reform in the United States. What are physicians to do when truly basic reform seems “politically nonviable” and the status quo is both ethically and economically nonviable? I argue that we ought to see what can be done to marshal political support behind a single-payer system. Whatever we do will have serious drawbacks in its implementation phase. A single-payer system seems to me to provide the sort of framework that will allow the drawbacks to be sorted out quickly

and to allow physicians who care about patients’ concerns to champion quality of care most effectively.

A brief form of Dr. Jacobson’s comment might be, “If you like the Post Office, you’ll love national health insurance.” We should first recall, however, that a single-payer system need not necessarily be a government-administered system; there are numerous alternative models. Second, the facts about government waste and inefficiency might not square with our natural prejudices — for instance, why does the US Social Security System pay 5 percent for administrative overhead while the average private health insurance company pays 15 percent?

Newsletters in Family Practice

To the Editor: I wish to compliment Dr. Shaughnessy and colleagues on their important original contribution to the continuing education of family physicians, “Survey and Evaluation of Newsletters Marketed to Family Physicians,”¹ which was objective, balanced, and fair.

The authors evaluated eight newsletters and summarized their data in helpful graphs. What was missing, however, was any elaboration of the subjective differences in these newsletters, which are large and important.

Questions that readers will have include the following: is the content directly relevant to office practice? Is the style readable and engaging? Is the point of view that of a generalist or a specialist? The most important question is whether there is a consistent philosophy of medical care and practice presented or are the chosen abstracts supposed to represent a value-neutral smorgasbord of noteworthy recent literature. The studies that are left out of these newsletters are as important as what is included. These choices are not random and are worth considering; they should be made explicit. For the record, I would like to state mine.

My goal in presenting *The Family Practice Newsletter* is to identify, synthesize, and persuade. I present my data from the perspective of an individual, practicing, generalist physician who is looking at a large amount of expert information both from peers and from specialists in other fields. I convey the personal dilemmas that I have faced in trying to scan a too voluminous literature, in trying to extract the small amount that can and should become familiar to practicing physicians, and in trying to incorporate these individual pieces of data into a coherent, systematic, and value-laden framework.

Two central biases permeate all of my work — that the practice of medicine should make sense to the practitioner and that the appropriate response to modern information overload is strategic learning (as through newsletters) and strategic practice. Strategic
